

Perfect teeth in five easy steps.

CEREC is a sophisticated computer-aided system for producing durable high-quality ceramic restorations. It is simple to use, fast and conserves the natural tooth. CEREC is ideal for patients who want an authentic tooth-coloured alternative to amalgam or gold. In many cases CEREC allows tooth restorations to be completed in a single session – without impressions, temporaries or long waiting periods.

Before treatment starts your dentist will inform you about all the benefits of CEREC.

The first step is to remove the dental caries and/or the existing filling. The CEREC measuring camera then takes a three-dimensional photograph of your tooth.

The contours of the ceramic restoration are designed on the computer monitor.

CEREC automatically mills the restoration out of a tooth-coloured ceramic block.

Finally, the restoration is inserted into your tooth and polished. The finished ceramic restoration looks and feels exactly like natural dental enamel.

- Durable ceramic material
- Aesthetic
- Biocompatible
- Natural-looking
- Conserves the natural tooth
- Affordable
- Only one treatment session required

We'll gladly supply further information.
